

ComfyGo

Technical Documentation

Partho Deb · ID: 241-134-016 · Batch: 6th

1. Project Overview

ComfyGo is a travel and tourism management system where users can book hotels, transportation (train, bus, airplane, launch), and tour guides. It also provides a list of tourist spots and allows users to send contact messages.

2. Technology Stack

Layer	Details
Frontend	HTML5, CSS3, JavaScript
Backend	PHP (Server-side scripting)
Database	MySQL (Relational Database)
Environment	XAMPP (Apache + MySQL + PHP)
Version Control	Git & GitHub

3. Database Schema

3.1 Users Table

Stores user login and profile information.

Column	Type	Key
user_ID	VARCHAR(100)	Primary Key
user_email	VARCHAR(100)	UNIQUE
user_name	VARCHAR(100)	
user_phone	VARCHAR(20)	
password	VARCHAR(255)	

3.2 Hotels Table

Stores hotel information.

Column	Type	Key
hotel_registration_number	VARCHAR(100)	Primary Key
hotel_name	VARCHAR(100)	
hotel_division	VARCHAR(100)	

hotel_district	VARCHAR(100)	
hotel_location	VARCHAR(150)	
hotel_rating	VARCHAR(50)	
hotel_price	INT	
hotel_description	TEXT	

3.3 Manager Table

Stores hotel manager details. FK: hotel_registration_number → Hotels.

Column	Type	Key
manager_ID	VARCHAR(100)	Primary Key
manager_name	VARCHAR(100)	
manager_email	VARCHAR(100)	UNIQUE
manager_mobile	VARCHAR(20)	
hotel_registration_number	VARCHAR(100)	Foreign Key
password	VARCHAR(255)	

3.4 Transportation Table

Stores transport service data.

Column	Type	Key
transport_ID	VARCHAR(100)	Primary Key
transport_type	VARCHAR(50)	
transport_route	VARCHAR(100)	
transport_fare	INT	

3.5 Guide Table

Stores tourist guide details.

Column	Type	Key
guide_NID	VARCHAR(100)	Primary Key
guide_name	VARCHAR(100)	
guide_email	VARCHAR(100)	UNIQUE
guide_mobile	VARCHAR(20)	
guide_division	VARCHAR(100)	
guide_district	VARCHAR(100)	
guide_rate	INT	
password	VARCHAR(255)	

3.6 Booking Table

Stores booking information. FKs: user_ID, guide_NID, hotel_registration_number, transport_ID.

Column	Type	Key
booking_ID	VARCHAR(100)	Primary Key
booking_Type	VARCHAR(100)	
booking_confirmation	VARCHAR(100)	
user_ID	VARCHAR(100)	Foreign Key
booking_date	DATE	
guide_NID	VARCHAR(100)	Foreign Key
hotel_registration_number	VARCHAR(100)	Foreign Key
transport_ID	VARCHAR(100)	Foreign Key

3.7 Payment Table

Stores payment details. FKs: booking_ID, user_ID.

Column	Type	Key
payment_ID	VARCHAR(100)	Primary Key
booking_ID	VARCHAR(100)	Foreign Key
price	INT	
user_ID	VARCHAR(100)	Foreign Key
payment_date	DATE	
payment_method	VARCHAR(50)	

3.8 ContactMessages Table

Stores contact form submissions.

Column	Type	Key
message_ID	VARCHAR(100)	Primary Key
name	VARCHAR(100)	
email	VARCHAR(100)	
phone	VARCHAR(20)	
message	TEXT	
submitted_at	TIMESTAMP	

3.9 TouristSpots Table

Stores tourist spot information.

Column	Type	Key
spot_id	VARCHAR(100)	Primary Key
spot_name	VARCHAR(150)	
city	VARCHAR(100)	
division	VARCHAR(100)	
description	TEXT	

image_url	VARCHAR(255)	
best_season	VARCHAR(100)	
entry_fee	INT	
estimated_hours	DECIMAL(4,1)	

4. Setup Steps (Run Locally)

1. Goto github repository and clone it
<https://github.com/parthodeb03/Project-Comfy-Go-website> into xampp htdocs folder
2. Then open the project folder in Vs Code
3. Go to Xampp control start apache and mysql
4. In project file terminal write mysql -u root -p
5. Press enter 2 times
6. Write SOURCE C:\xampp\htdocs\ComfyGoWebsite\Database\comfygo_db.sql;
7. Open chrome and write http://localhost/ComfyGoWebsite

5. Features

User Features

- User Registration and Login
- Browse Hotels
- Browse Transport Options (Train, Bus, Airplane, Launch)
- Browse Tourist Spots
- Book Guide / Hotel / Transport
- Make Payment
- View Booking Status
- Contact Support via Message Form

Manager Features

- Hotel manager linked to a hotel
- Manage hotel info and pricing
- Approve or reject tourist bookings
- View booking history with tourist contact details

Guide Features

- Update profile, location, and daily rate
- View booked tourists with dates
- Approve or reject pending bookings

6. User Guide

How to Register

- Go to the Register page
- Enter name, email, phone, password
- Submit form
- Account created in Users table

How to Book a Service

- Login to the system

- Choose service type: Hotel, Transport, or Guide
- Fill booking form and submit
- Booking saved in Booking table with status Pending
- Manager or Guide approves/rejects — status updates in real time

How Payment Works

- Booking is created automatically with payment record
- Hotel booking: total = hotel_price x persons x nights
- Guide/Transport: rate stored at time of booking
- Payment record linked via booking_ID

Contact Message Submission

- Go to Contact page
- Fill name, email, phone, message
- Submit — stored in ContactMessages table

7. Code Walkthrough (Backend Flow)

Login System Flow

- User submits email and password
- PHP checks Users table with prepared statement
- If match: session created, user redirected to dashboard
- If no match: redirect to login.php with error

Booking System Flow

- Form collects booking info (type, date, service ID)
- INSERT into Booking table with status = Pending
- INSERT into Payment table with calculated price
- Manager/Guide dashboard shows pending item for approval

Tourist Spots Page Flow

Query fetches all spots filtered by city (Dhaka, Sylhet, Chittagong):

```
SELECT city, spot_name, description, best_season, entry_fee, estimated_hours
FROM TouristSpots WHERE city IN ('Dhaka','Sylhet','Chittagong')
```

Spots are displayed in card format per city with an interactive cost estimator.

8. Bug Description

Data Fetching Error Causing Wrong Redirect

When a user tries to log in or book a service, the system sometimes fails to fetch database results correctly and redirects to the wrong page.

Cause

Incorrect result checking — comparing an array to a number:

```
$result = mysqli_query($conn, $sql);
$row = mysqli_fetch_assoc($result);
if($row > 0) { // WRONG: $row is array, not number
    header('Location: dashboard.php');
}
```

Correct Fix

```
$result = mysqli_query($conn, $sql);
if(mysqli_num_rows($result) > 0) {
```

```
$_SESSION['user'] = $email;
header('Location: dashboard.php');
} else {
header('Location: login.php?error=invalid');
}
```

Why This Fix Works

- mysqli_num_rows() properly checks if records exist
- Redirect works correctly because condition is a valid integer comparison
- Prevents session errors and infinite login redirect loop

10. Screenshot of 3 important code files

- 1. db.php** : It connects with the mysql database with php
- 2. Index.php** : It is the main homepage of the website
- 3. Tourist.php**: It is a section of the normal users as a tourist. There are different kinds of dashboards in this.

11. Screenshot of main pages

This is the main index page

This the tourist dashboard

This is the guide dashboard

This is the Hotel manager dashboard
